Our mission is to continue to deliver solutions that will revolutionise the security model while ensuring the integrity of information our customers transact online each day between themselves and other parties is not compromised.

Ted Egan CEO

About TrustDefender

An Australian company founded in January 2006, TrustDefender is an award-winning and leading innovator in integrated security and fraud risk management solutions.

Why we're different

TrustDefender's products increase the fraud detection and prevention capabilities for an online business, effectively providing a complete end-to-end solution to the two major scenarios that any online business faces:

- 1) Identity Takeover - Making sure confidential information (such as usernames, passwords, multi-factor tokens and other details) are not compromised and stolen by cybercriminals in the first place through malware or other means.
- 2) Making sure cybercriminals who have stolen credentials can't do anything malicious with that information once they try to use it.

Amongst an extensive range of capabilities, TrustDefender's solutions integrate the end-user and their computing device into the overall security chain and stops hidden malware that takes advantage of authenticated sessions from breaking into organisations, bank accounts and other online services and databases.

TrustDefender allows secure transactions even on computers infected by known or unknown malware.

In addition, TrustDefender gives organisations unprecedented visibility into the security health status of all computers, smartphones, tablets and other Internet-connected devices that are connecting to that organisations network and online services, while delivering visibility into types of malware threats directing the attacks.

If there is a potential problem identified with a transaction, the "instant decisioning" process applies and lets the organisation make decisions in real-time based on this previously untapped information.

TrustDefender's third-generation security suite

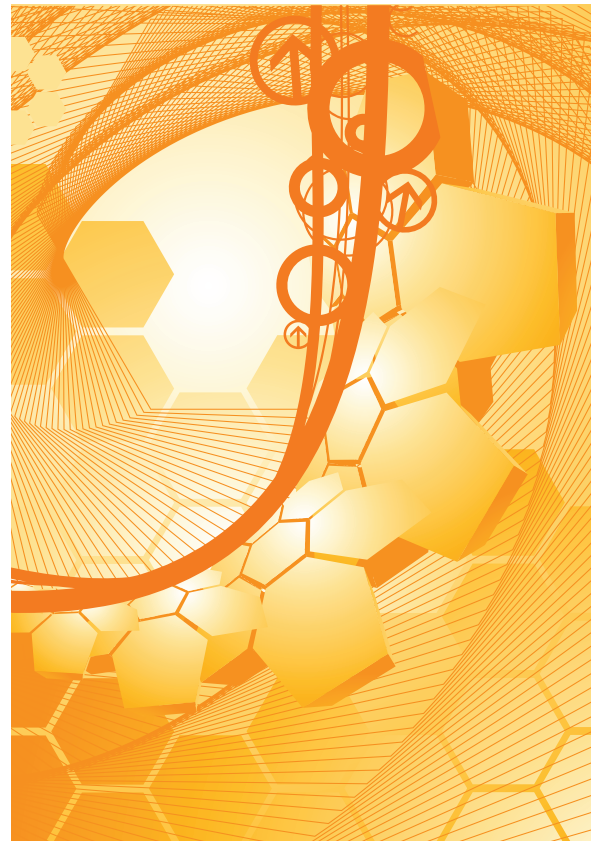

The TrustDefender security suite includes TrustDefender Zero, TrustDefender Pro, TrustDefender FixIt, the TrustDefender Central Intelligence Server, TrustDefender VPN and TrustDefender Cloud.

TrustDefender Zero uses next-generation technology for fraud risk management that requires no end-user download or intervention and provides 100% coverage across any and all devices connecting to an organisation's network, whether internally or externally.

TrustDefender Pro is an Internet security software solution downloaded to end-user computers. Bringing integrity back to the internet, it secures the Internet session solving the issues facing organisations where an increasing percentage of their customer base connects to online services for banking and ecommerce.

TrustDefender VPN delivers secure remote access protection, while TrustDefender Cloud secures the cloud and delivers web application protection for all web application providers.

The TrustDefender Central Intelligence Server is enterprise server software that integrates into an organisation's IT infrastructure where information from TrustDefender Zero, TrustDefender Pro, TrustDefender VPN and TrustDefender Cloud is collated, actioned and secured in real-time.

TrustDefender Labs and Malware Intelligence Advisory Services

TrustDefender also offers Malware Intelligence Advisory Services to major organisations on an annual subscription basis through TrustDefender Labs.

TrustDefender Labs sits within the company's Research and Development division, spanning the TrustDefender headquarters in Sydney, Australia, to TrustDefender's Advanced Threat Research Services division in the United Kingdom.
